AUDITED DETAILS

Audited Project

Project name	Token ticker	Blockchain	
MMPRO Token	MMPRO	Binance Smart Chain	

Addresses

Contract address	0x6067490d05f3cf2fdffc0e353b1f5fd6e5ccdf70
Contract deployer address	0x1Cc23586AeA610Df8e9a850B7393a1251A30EA8A

Project Website

https://marketmaking.pro/

Codebase

https://bscscan.com/address/0x6067490d05f3cf2fdffc0e353b1f5fd6e5ccdf70#code

SUMMARY

MMPRO Token is a part of our whole ecosystem—market making. Pro is an agency that provides market-making and liquidity services to exchanges and projects. Besides that, MMPRO is building a cross-chain multi-farming ecosystem.

Contract Summary

Documentation Quality

MMPRO Token provides a very poor documentation with standard of solidity base code.

• The technical description is provided unclear and disorganized.

Code Quality

The Overall quality of the basecode is poor.

• Solidity basecode and rules are unclear and disorganized by MMPRO Token.

Test Coverage

Test coverage of the project is 100% (Through Codebase)

Audit Findings Summary

- SWC-100 SWC-108 | Explicitly define visibility for all state variables on lines 68, 211, 218, 238, 101 and 155.
- SWC-103 | Pragma statements can be allowed to float when a contract is intended on lines 5.
- SWC-110 SWC-123 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 103 and 98.
- SWC-111 | It is recommended to use alternatives to the deprecated constructions on lines 30, 36, 43, 48, 89, 130, 140 and 201.

CONCLUSION

We have audited the MMPRO Token project released on October 2021 to find issues and identify potential security vulnerabilities in the MMPRO Token project. This process is used to find technical issues and security loopholes that may be found in smart contracts.

The security audit report yielded unsatisfactory results, discovering medium-risk and low-risk issues.

Writing a contract that does not follow the Solidity style guide can pose a significant risk. The serious and low problems we found in the smart contract are An assertion violation triggered, a low-risk issue, a floating pragma is set, and state variable visibility is not set. The smart contract delegates execution to a user-supplied address. It is possible to trigger an assertion violation. Solidity assert() statements should only be used to check invariants. Review the transaction trace generated for this issue and either make sure your program logic is correct or use require() instead of assert() if your goal is to constrain user inputs or enforce preconditions. Remember to validate inputs from both callers (via passed arguments) and callees (for instance, via return values). A floating pragma is set, and the current pragma Solidity directive is ""^0.4.24"". Specifying a fixed compiler version is recommended to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.

We were recommended to keep being aware of investing in this risky smart contract.

AUDIT RESULT

Article	Category	Description	Result	
Default Visibility	SWC-100 SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	ISSUF	
Integer Overflow and Underflow	SWC-101	If unchecked math is used, all math operations should be safe from overflows and underflows.	PASS	
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.	PASS	
Floating Pragma	SWC-103	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.		
Unchecked Call Return Value	SWC-104	The return value of a message call should be checked.		
Unprotected Ether Withdrawal	SWC-105	Due to missing or insufficient access controls, malicious parties can withdraw from the contract.		
SELFDESTRUCT Instruction	SWC-106	The contract should not be self-destructible while it has funds belonging to users.		
Reentrancy	SWC-107	7 Check effect interaction pattern should be followed if the code performs recursive call.		
Uninitialized Storage Pointer	SWC-109	Uninitialized local storage variables can point to unexpected storage locations in the contract.		
Assert Violation	SWC-110 SWC-123	, ,		
Deprecated Solidity Functions	SWC-111	Deprecated built-in functions should never be used.	ISSUE FOUND	
Delegate call to Untrusted Callee	SWC-112	Delegatecalls should only be allowed to trusted addresses.		

DoS (Denial of Service)	SWC-113 SWC-128	Execution of the code should never be blocked by a specific contract state unless required.	PASS
Race Conditions	SWC-114	Race Conditions and Transactions Order Dependency should not be possible.	
Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	PASS
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	PASS
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Incorrect Constructor Name	SWC-118	Constructors are special functions that are called only once during the contract creation.	
Shadowing State Variable	SWC-119	State variables should not be shadowed.	
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	
Write to Arbitrary Storage Location	SWC-124	The contract is responsible for ensuring that only authorized user or contract accounts may write to sensitive storage locations.	
Incorrect Inheritance Order	SWC-125		PASS
Insufficient Gas Griefing	SWC-126	Insufficient gas griefing attacks can be performed on contracts which accept data and use it in a sub-call on another contract.	
Arbitrary Jump Function	SWC-127	As Solidity doesnt support pointer arithmetics, it is impossible to change such variable to an arbitrary value.	

Typographical Error	SWC-129	A typographical error can occur for example when the intent of a defined operation is to sum a number to a variable.	PASS	
Override control character	SWC-130	Malicious actors can use the Right-To-Left-Override unicode character to force RTL text rendering and confuse users as to the real intent of a contract.		
Unused variables	SWC-131 SWC-135	Unused variables are allowed in Solidity and they do not pose a direct security issue.	PASS	
Unexpected Ether balance	SWC-132	Contracts can behave erroneously when they strictly assume a specific Ether balance.		
Hash Collisions Variable	SWC-133	Using abi.encodePacked() with multiple variable length arguments can, in certain situations, lead to a hash collision.		
Hardcoded gas amount	SWC-134	The transfer() and send() functions forward a fixed amount of 2300 gas.		
Unencrypted Private Data	SWC-136	It is a common misconception that private type variables cannot be read.	PASS

SWC-110 | AN ASSERTION VIOLATION WAS TRIGGERED.

LINE 103

medium SEVERITY

It is possible to trigger an assertion violation. Note that Solidity assert() statements should only be used to check invariants. Review the transaction trace generated for this issue and either make sure your program logic is correct, or use require() instead of assert() if your goal is to constrain user inputs or enforce preconditions. Remember to validate inputs from both callers (for instance, via passed arguments) and callees (for instance, via return values).

Source File

- MMPRO.sol

```
102
103 bool public locked = true;
104
105 function setLocked(bool _locked) public onlyOwner {
106 locked = _locked;
107
```

LINE 68

low SEVERITY

The function definition of "Ownable" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

Source File

- MMPRO.sol

```
67 */
68 function Ownable() {
69 owner = msg.sender;
70 }
71
72
```

LINE 211

low SEVERITY

The function definition of "increaseApproval" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

Source File

- MMPRO.sol

```
210 */
211 function increaseApproval (address _spender, uint _addedValue)
212 returns (bool success) {
213 allowed[msg.sender][_spender] = allowed[msg.sender][_spender].add(_addedValue);
214 Approval(msg.sender, _spender, allowed[msg.sender][_spender]);
215
```

LINE 218

low SEVERITY

The function definition of "decreaseApproval" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

Source File

- MMPRO.sol

```
217
218 function decreaseApproval (address _spender, uint _subtractedValue)
219 returns (bool success) {
220 uint oldValue = allowed[msg.sender][_spender];
221 if (_subtractedValue > oldValue) {
222
```

LINE 238

low SEVERITY

The function definition of "MMPRO" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

Source File

- MMPRO.sol

```
237
238 function MMPRO () {
239 totalSupply = initialSupply;
240 balances[msg.sender] = initialSupply;
241
242
```

SWC-103 | A FLOATING PRAGMA IS SET.

LINE 5

low SEVERITY

The current pragma Solidity directive is ""^0.4.24"". It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.

Source File

- MMPRO.sol

SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 101

low SEVERITY

It is best practice to set the visibility of state variables explicitly. The default visibility for "balances" is internal. Other possible visibility settings are public and private.

Source File

- MMPRO.sol

```
100
101 mapping(address => uint256) balances;
102
103 bool public locked = true;
104
105
```

SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 155

low SEVERITY

It is best practice to set the visibility of state variables explicitly. The default visibility for "allowed" is internal. Other possible visibility settings are public and private.

Source File

- MMPRO.sol

```
154
155 mapping (address => mapping (address => uint256)) allowed;
156
157 /**
158 * @dev Transfer tokens from one address to another
159
```

SWC-110 | AN ASSERTION VIOLATION WAS TRIGGERED.

LINE 98

low SEVERITY

It is possible to cause an assertion violation. Note that Solidity assert() statements should only be used to check invariants. Review the transaction trace generated for this issue and either make sure your program logic is correct, or use require() instead of assert() if your goal is to constrain user inputs or enforce preconditions. Remember to validate inputs from both callers (for instance, via passed arguments) and callees (for instance, via return values).

Source File

- MMPRO.sol

```
97 */
98 contract BasicToken is ERC20Basic, Ownable {
99 using SafeMath for uint256;
100
101 mapping(address => uint256) balances;
102
```

LINE 30

low SEVERITY

Using "constant" as a state mutability modifier in function "mul" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
29  library SafeMath {
30  function mul(uint256 a, uint256 b) internal constant returns (uint256) {
31  uint256 c = a * b;
32  assert(a == 0 || c / a == b);
33  return c;
34
```

LINE 36

low SEVERITY

Using "constant" as a state mutability modifier in function "div" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
function div(uint256 a, uint256 b) internal constant returns (uint256) {

// assert(b > 0); // Solidity automatically throws when dividing by 0

uint256 c = a / b;

// assert(a == b * c + a % b); // There is no case in which this doesn't hold
```

LINE 43

low SEVERITY

Using "constant" as a state mutability modifier in function "sub" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
42
43 function sub(uint256 a, uint256 b) internal constant returns (uint256) {
44 assert(b <= a);
45 return a - b;
46 }
47</pre>
```

LINE 48

low SEVERITY

Using "constant" as a state mutability modifier in function "add" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
47
48  function add(uint256 a, uint256 b) internal constant returns (uint256) {
49   uint256 c = a + b;
50   assert(c >= a);
51   return c;
52
```

LINE 89

low SEVERITY

Using "constant" as a state mutability modifier in function "balanceOf" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
88  uint256 public totalSupply;
89  function balanceOf(address who) public constant returns (uint256);
90  function transfer(address to, uint256 value) public returns (bool);
91  event Transfer(address indexed from, address indexed to, uint256 value);
92  }
93
```

LINE 130

low SEVERITY

Using "constant" as a state mutability modifier in function "balanceOf" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
129 */
130 function balanceOf(address _owner) public constant returns (uint256 balance) {
131 return balances[_owner];
132 }
133 }
134
```

LINE 140

low SEVERITY

Using "constant" as a state mutability modifier in function "allowance" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
contract ERC20 is ERC20Basic {
140  function allowance(address owner, address spender) public constant returns
(uint256);
141  function transferFrom(address from, address to, uint256 value) public returns
(bool);
142  function approve(address spender, uint256 value) public returns (bool);
143  event Approval(address indexed owner, address indexed spender, uint256 value);
144
```

LINE 201

low SEVERITY

Using "constant" as a state mutability modifier in function "allowance" is disallowed as of Solidity version 0.5.0. Use "view" instead.

Source File

- MMPRO.sol

```
200 */
201 function allowance(address _owner, address _spender) public constant returns
(uint256 remaining) {
202 return allowed[_owner][_spender];
203 }
204
205
```

DISCLAIMER

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to you ("Customer" or the "Company") in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to, or relied upon by any person for any purposes, nor may copies be delivered to any other person other than the Company, without Sysfixed's prior written consent in each instance.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Sysfixed to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model, or legal compliance.

This is a limited report on our findings based on our analysis, in accordance with good industry practice as of the date of this report, in relation to cybersecurity vulnerabilities and issues in the framework and algorithms based on smart contracts, the details of which are set out in this report. In order to get a full view of our analysis, it is crucial for you to read the full report. While we have done our best in conducting our analysis and producing this report, it is important to note that you should not rely on this report and cannot claim against us on the basis of what it says or doesn't say, or how we produced it, and it is important for you to conduct your own independent investigations before making any decisions. We go into more detail on this in the below disclaimer below – please make sure to read it in full.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

This report is provided for information purposes only and on a non-reliance basis and does not constitute investment advice. ABOUT US

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
