
Octopus Market

Smart Contract Audit Report

SYSFIXED

07 Apr 2022

TABLE OF CONTENTS

AUDITED DETAILS

Audited Project

Project name	Token ticker	Blockchain
Octopus Market	OTP	Ethereum

Addresses

Contract address	0x8b42d5640515685b9d5acec14952dd289cbe4b4c
Contract deployer address	0x297b7C939BfCa21c3376728f0114fE89377A2AdE

Project Website

https://t.me/+Q7atGXiKkQJjNWZi

Codebase

https://etherscan.io/address/0x8b42d5640515685b9d5acec14952dd289cbe4b4c#code

SUMMARY

Our main goal is to launch a full functional market website and application where people can buy sell and exchange items using cryptocurrencies, much like amazon eBay and AliExpress. Our vision is to make cryptocurrencies as much as usable as fiat currencies

Contract Summary

Documentation Quality

Octopus Market provides a very good documentation with standard of solidity base code.

- The technical description is provided clearly and structured and also dont have any high risk issue.

Code Quality

The Overall quality of the basecode is standard.

- Standard solidity basecode and rules are already followed by Octopus Market with the discovery of several low issues.

Test Coverage

Test coverage of the project is 100% (Through Codebase)

Audit Findings Summary

- SWC-100 SWC-108 | Explicitly define visibility for all state variables on lines 715.
- SWC-101 | It is recommended to use vetted safe math libraries for arithmetic operations consistently on lines 103, 135, 158, 159, 194, 230, 456, 691, 691, 692, 692, 718, 718 and 886.
- SWC-110 SWC-123 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 887, 887, 888, 889, 990 and 991.

CONCLUSION

We have audited the Octopus Market project released on April 2022 to discover issues and identify potential security vulnerabilities in Octopus Market Project. This process is used to find technical issues and security loopholes which might be found in the smart contract.

The security audit report provides a satisfactory result with some low-risk issues.

The issues found in the Octopus Market smart contract code do not pose a considerable risk. The writing of the contract is close to the standard of writing contracts in general. The low-risk issues found are some arithmetic operation issues, a state variable visibility is not set and out of bounds array access which the index access expression can cause an exception in case of the use of an invalid array index value.

AUDIT RESULT

Article	Category	Description	Result
Default Visibility	SWC-100 SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	ISSUE FOUND
Integer Overflow and Underflow	SWC-101	If unchecked math is used, all math operations should be safe from overflows and underflows.	ISSUE FOUND
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.	PASS
Floating Pragma	SWC-103	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	PASS
Unchecked Call Return Value	SWC-104	The return value of a message call should be checked.	PASS
Unprotected Ether Withdrawal	SWC-105	Due to missing or insufficient access controls, malicious parties can withdraw from the contract.	PASS
SELFDESTRUCT Instruction	SWC-106	The contract should not be self-destructible while it has funds belonging to users.	PASS
Reentrancy	SWC-107	Check effect interaction pattern should be followed if the code performs recursive call.	PASS
Uninitialized Storage Pointer	SWC-109	Uninitialized local storage variables can point to unexpected storage locations in the contract.	PASS
Assert Violation	SWC-110 SWC-123	Properly functioning code should never reach a failing assert statement.	ISSUE FOUND
Deprecated Solidity Functions	SWC-111	Deprecated built-in functions should never be used.	PASS
Delegate call to Untrusted Callee	SWC-112	Delegatecalls should only be allowed to trusted addresses.	PASS

DoS (Denial of Service)	SWC-113 SWC-128	Execution of the code should never be blocked by a specific contract state unless required.	PASS
Race Conditions	SWC-114	Race Conditions and Transactions Order Dependency should not be possible.	PASS
Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	PASS
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	PASS
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Incorrect Constructor Name	SWC-118	Constructors are special functions that are called only once during the contract creation.	PASS
Shadowing State Variable	SWC-119	State variables should not be shadowed.	PASS
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	PASS
Write to Arbitrary Storage Location	SWC-124	The contract is responsible for ensuring that only authorized user or contract accounts may write to sensitive storage locations.	PASS
Incorrect Inheritance Order	SWC-125	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order. The rule of thumb is to inherit contracts from more /general/ to more /specific/.	PASS
Insufficient Gas Griefing	SWC-126	Insufficient gas griefing attacks can be performed on contracts which accept data and use it in a sub-call on another contract.	PASS
Arbitrary Jump Function	SWC-127	As Solidity doesnt support pointer arithmetics, it is impossible to change such variable to an arbitrary value.	PASS

Typographical Error	SWC-129	A typographical error can occur for example when the intent of a defined operation is to sum a number to a variable.	PASS
Override control character	SWC-130	Malicious actors can use the Right-To-Left-Override unicode character to force RTL text rendering and confuse users as to the real intent of a contract.	PASS
Unused variables	SWC-131 SWC-135	Unused variables are allowed in Solidity and they do not pose a direct security issue.	PASS
Unexpected Ether balance	SWC-132	Contracts can behave erroneously when they strictly assume a specific Ether balance.	PASS
Hash Collisions Variable	SWC-133	Using abi.encodePacked() with multiple variable length arguments can, in certain situations, lead to a hash collision.	PASS
Hardcoded gas amount	SWC-134	The transfer() and send() functions forward a fixed amount of 2300 gas.	PASS
Unencrypted Private Data	SWC-136	It is a common misconception that private type variables cannot be read.	PASS

SMART CONTRACT ANALYSIS

This plugin produces issues to support false positive discovery within mythril.

Source File

- OTP.sol

Locations

```
717
718   uint256 private numTokensSellToAddToLiquidity = 80000 * 10**18;
719
720   event MinTokensBeforeSwapUpdated(uint256 minTokensBeforeSwap);
721   event SwapAndLiquifyEnabledUpdated(bool enabled);
722
```

SWC-101 | ARITHMETIC OPERATION "++" DISCOVERED

LINE 886

low SEVERITY

This plugin produces issues to support false positive discovery within mythril.

Source File

- OTP.sol

Locations

```
885   uint256 tSupply = _tTotal;
886   for (uint256 i = 0; i < _excluded.length; i++) {
887   if (_rOwned[_excluded[i]] > rSupply || _tOwned[_excluded[i]] > tSupply) return
(_rTotal, _tTotal);
888   rSupply = rSupply.sub(_rOwned[_excluded[i]]);
889   tSupply = tSupply.sub(_tOwned[_excluded[i]]);
890
```

SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 715

low SEVERITY

It is best practice to set the visibility of state variables explicitly. The default visibility for "inSwapAndLiquify" is internal. Other possible visibility settings are public and private.

Source File

- OTP.sol

Locations

```
714
715   bool inSwapAndLiquify;
716   bool public swapAndLiquifyEnabled = true;
717
718   uint256 private numTokensSellToAddToLiquidity = 80000 * 10**18;
719
```

SWC-110 | OUT OF BOUNDS ARRAY ACCESS

LINE 887

low SEVERITY

The index access expression can cause an exception in case of use of invalid array index value.

Source File

- OTP.sol

Locations

```
886   for (uint256 i = 0; i < _excluded.length; i++) {
887   if (_rOwned[_excluded[i]] > rSupply || _tOwned[_excluded[i]] > tSupply) return
(_rTotal, _tTotal);
888   rSupply = rSupply.sub(_rOwned[_excluded[i]]);
889   tSupply = tSupply.sub(_tOwned[_excluded[i]]);
890   }
891
```

SWC-110 | OUT OF BOUNDS ARRAY ACCESS

LINE 887

low SEVERITY

The index access expression can cause an exception in case of use of invalid array index value.

Source File

- OTP.sol

Locations

```
886   for (uint256 i = 0; i < _excluded.length; i++) {
887   if (_rOwned[_excluded[i]] > rSupply || _tOwned[_excluded[i]] > tSupply) return
(_rTotal, _tTotal);
888   rSupply = rSupply.sub(_rOwned[_excluded[i]]);
889   tSupply = tSupply.sub(_tOwned[_excluded[i]]);
890   }
891
```

ABOUT US

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
