About Us

AUDITED DETAILS

| Audited Project

Project name	Token ticker	Blockchain	
Yutu	YUTU	Binance Smart Chain	

Addresses

Contract address	0x552c0d42480fb13C2398ACfB0872F3Bc395Dfdec	
Contract deployer address	0x7822Dc0D417E5Fc91681B91F8E37120d6f8C8dc0	

Project Website

https://www.yutucoin.com/

Codebase

https://bscscan.com/address/0x552c0d42480fb13C2398ACfB0872F3Bc395Dfdec#code

SUMMARY

Yutu is the legendary rabbit and the goal is to create an entire rabbit universe on the BSC network. Inspired by the Chinese Mythology. The team has completed a 10,000x and \$20M project, so if you've missed out on many legends, join us and make a new one. Yutu will also be featured at the New Year's Eve party watched by 1.5 billion people in China.

Contract Summary

Documentation Quality

Yutu provides a very good documentation with standard of solidity base code.

• The technical description is provided clearly and structured and also dont have any high risk issue.

Code Quality

The Overall quality of the basecode is standard.

 Standard solidity basecode and rules are already followed by Yutu with the discovery of several low issues.

Test Coverage

Test coverage of the project is 100% (Through Codebase)

Audit Findings Summary

- SWC-101 | It is recommended to use vetted safe math libraries for arithmetic operations consistently on lines 137, 583, 615, 638, 639, 674, 710, 776, 780, 792, 799, 808, 980, 1033, 1096, 1124, 1128, 1250, 1252, 1259, 1266, 1388, 1389, 1398, 1399, 1408, 1409, 1424, 1610, 1612, 1613, 1614, 1615, 1616, 1622, 1623, 1624, 1625, 1626, 1631, 1632, 1633, 1634, 1635, 1661, 1674, 1692, 1718, 1720, 1779, 1788, 1801, 1873, 2021, 2031, 2035 and 137.
- SWC-103 | Pragma statements can be allowed to float when a contract is intended on line 7.
- SWC-110 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 108, 138, 143, 1425, 1729, 1730, 1745, 1746, 1837, 1838 and 2027.
- SWC-115 | tx.origin should not be used for authorization, use msg.sender instead on lines 1523 and 1704.
- SWC-120 | It is recommended to use external sources of randomness via oracles on lines 1384 and 1610.

CONCLUSION

We have audited the Yutu project released on September 2022 to discover issues and identify potential security vulnerabilities in Yutu Project. This process is used to find technical issues and security loopholes which might be found in the smart contract.

The security audit report provides a satisfactory result with some low-risk issues.

The issues found in the code on Yutu smart contract do not pose a considerable risk. The writing of the contract is close to the standard of writing contracts in general. The low-risk issues found are some arithmetic operation issues, a floating pragma is set, weak sources of randomness, tx.origin as a part of authorization control and out of bounds array access which the index access expression can cause an exception in case of the use of an invalid array index value.

AUDIT RESULT

Article	Category	Description	Result
Default Visibility	Default Visibility SWC-100 SWC-108 Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.		PASS
Integer Overflow and Underflow	SWC-101		ISSUE FOUND
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.	PASS
Floating Pragma	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.		ISSUE FOUND
Unchecked Call Return Value SWC-104 The return value of a message call should be checked. SELFDESTRUCT Instruction SWC-106 The contract should not be self-destructible while it has funds belonging to users. Reentrancy SWC-107 Check effect interaction pattern should be followed if the code performs recursive call.		PASS	
		PASS	
		PASS	
Assert Violation	Assert Violation SWC-110 Properly functioning code should never reach a failing assert statement.		ISSUE FOUND
Deprecated Solidity Functions	SWC-111	Deprecated built-in functions should never be used.	PASS
Delegate call to Untrusted Caller	SWC-112		PASS
· ·			PASS
Race Conditions SWC-114		Race Conditions and Transactions Order Dependency should not be possible.	PASS

Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	ISSUE FOUND
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	PASS
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Shadowing State Variable	SWC-119	State variables should not be shadowed.	PASS
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	ISSUE FOUND
Incorrect Inheritance Order	SWC-125	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order. The rule of thumb is to inherit contracts from more /general/ to more /specific/.	PASS

ABOUT US

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
