## About Us

## **AUDITED DETAILS**

## Audited Project

Project name	Token ticker	Blockchain	
ELTCOIN	ELTCOIN	Ethereum	

## Addresses

Contract address	0x44197a4c44d6a059297caf6be4f7e172bd56caaf
Contract deployer address	0xdcBd3b5605A525f12819958E0Cb02941C539EAb6

## Project Website

https://www.eltcoin.tech/

## Codebase

https://etherscan.io/address/0x44197a4c44d6a059297caf6be4f7e172bd56caaf#code

## **SUMMARY**

ELTCOIN is ethereum limited total coin with a community-driven currency that powers an open-sourced library of cool dapps built on Ethereum. the PROJECTS is Get rewarded by contributing to our different projects or by starting your own!

## Contract Summary

## **Documentation Quality**

ELTCOIN provides a very good documentation with standard of solidity base code.

• The technical description is provided clearly and structured and also dont have any high risk issue.

## **Code Quality**

The Overall quality of the basecode is standard.

 Standard solidity basecode and rules are already followed by ELTCOIN with the discovery of several low issues.

#### **Test Coverage**

Test coverage of the project is 100% (Through Codebase)

## Audit Findings Summary

- SWC-100 SWC-108 | Explicitly define visibility for all state variables on lines 154, 161, 188, 232, 56 and 97.
- SWC-103 | Pragma statements can be allowed to float when a contract is intended on lines 5.
- SWC-110 SWC-123 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 32 and 26.
- SWC-111 | It is recommended to use alternatives to the deprecated constructions on lines 12, 18, 25, 30, 44, 78, 89 and 144.

## CONCLUSION

We have audited the ELTCOIN project released on October 2017 to discover issues and identify potential security vulnerabilities in ELTCOIN Project. This process is used to find technical issues and security loopholes which might be found in the smart contract.

The security audit report provides a satisfactory result with some low-risk issues.

The issues found in the ELTCOIN smart contract code do not pose a considerable risk. The writing of the contract is close to the standard of writing contracts in general. The low-risk issues found are a floating pragma is set, a state variable visibility is not set, an assertion violation is triggered and the use of "constant" state mutability that has been deprecated. It is recommended to use alternatives to the deprecated constructions.

## **AUDIT RESULT**

Article	Category	Description	Result	
Default Visibility	SWC-100 SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	ISSUE FOUND	
Integer Overflow and Underflow	SWC-101	If unchecked math is used, all math operations should be safe from overflows and underflows.	PASS	
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.		
Floating Pragma	SWC-103	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	ISSUE FOUND	
Unchecked Call Return Value	SWC-104	The return value of a message call should be checked.	PASS	
Unprotected Ether Withdrawal	SWC-105	Due to missing or insufficient access controls, malicious parties can withdraw from the contract.	PASS	
SELFDESTRUCT Instruction	SWC-106	The contract should not be self-destructible while it has funds belonging to users.	PASS	
Reentrancy	Check effect interaction pattern should be followed if the code performs recursive call.		PASS	
Uninitialized Storage Pointer	SWC-109		PASS	
Assert Violation	SWC-110 Properly functioning code should never reach a SWC-123 failing assert statement.		ISSUE FOUND	
Deprecated Solidity Functions	SWC-111	Deprecated built-in functions should never be used.	ISSUE FOUND	
Delegate call to Untrusted Callee	SWC-112	Delegatecalls should only be allowed to trusted addresses.	PASS	

DoS (Denial of Service)	SWC-113 SWC-128	Execution of the code should never be blocked by a specific contract state unless required.	PASS
Race Conditions	SWC-114	Race Conditions and Transactions Order Dependency should not be possible.	
Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Incorrect Constructor Name	SWC-118	Constructors are special functions that are called only once during the contract creation.	
Shadowing State Variable	SWC-119	State variables should not be shadowed.	
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	
Write to Arbitrary Storage Location	SWC-124	The contract is responsible for ensuring that only authorized user or contract accounts may write to sensitive storage locations.	
Incorrect Inheritance Order  When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order. The rule of thumb is to inherit contracts from more /general/ to more /specific/.		PASS	
Insufficient Gas Griefing	SWC-126	Insufficient gas griefing attacks can be performed on contracts which accept data and use it in a sub-call on another contract.	
Arbitrary Jump Function	SWC-127	As Solidity doesnt support pointer arithmetics, it is impossible to change such variable to an arbitrary value.	PASS

Typographical Error	SWC-129	A typographical error can occur for example when the intent of a defined operation is to sum a number to a variable.	PASS
Override control character	SWC-130	Malicious actors can use the Right-To-Left-Override unicode character to force RTL text rendering and confuse users as to the real intent of a contract.	
Unused variables	SWC-131 SWC-135	Unused variables are allowed in Solidity and they do not pose a direct security issue.	PASS
Unexpected Ether balance	SWC-132	Contracts can behave erroneously when they strictly assume a specific Ether balance.	
Hash Collisions Variable	SWC-133	Using abi.encodePacked() with multiple variable length arguments can, in certain situations, lead to a hash collision.	
Hardcoded gas amount	SWC-134	The transfer() and send() functions forward a fixed amount of 2300 gas.	
Unencrypted Private Data	SWC-136	It is a common misconception that private type variables cannot be read.	PASS

## **SMART CONTRACT ANALYSIS**

Started	Monday Oct 09 2017 07:06:22 GMT+0000 (Coordinated Universal Time)		
Finished	Tuesday Oct 10 2017 01:20:07 GMT+0000 (Coordinated Universal Time)		
Mode	Standard		
Main Source File	ELTCoin.sol

**LINE 154** 

## **low SEVERITY**

The function definition of "increaseApproval" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

## Source File

- ELTCoin.sol

```
153 */
154 function increaseApproval (address _spender, uint _addedValue) returns (bool success) {
155 require(isPreSaleReady);
156 allowed[msg.sender][_spender] = allowed[msg.sender][_spender].add(_addedValue);
157 Approval(msg.sender, _spender, allowed[msg.sender][_spender]);
158
```

**LINE 161** 

## **low SEVERITY**

The function definition of "decreaseApproval" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

## Source File

- ELTCoin.sol

```
160
161 function decreaseApproval (address _spender, uint _subtractedValue) returns (bool success) {
162 require(isPreSaleReady);
163 uint oldValue = allowed[msg.sender][_spender];
164 if (_subtractedValue > oldValue) {
165
```

**LINE 188** 

## **low SEVERITY**

The function definition of "Ownable" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

## Source File

- ELTCoin.sol

```
187 */
188 function Ownable() {
189 owner = msg.sender;
190 }
191
192
```

**LINE 232** 

## **low SEVERITY**

The function definition of "ELTCoin" lacks a visibility specifier. Note that the compiler assumes "public" visibility by default. Function visibility should always be specified explicitly to assure correctness of the code and improve readability.

## Source File

- ELTCoin.sol

```
231 */
232 function ELTCoin() {
233 totalSupply = INITIAL_SUPPLY;
234 balances[msg.sender] = INITIAL_SUPPLY;
235 }
236
```

## SWC-103 | A FLOATING PRAGMA IS SET.

LINE 5

## **low SEVERITY**

The current pragma Solidity directive is ""^0.4.15"". It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.

## Source File

- ELTCoin.sol

```
pragma solidity ^0.4.15;

/**

* @title SafeMath
```

## SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 56

## **low SEVERITY**

It is best practice to set the visibility of state variables explicitly. The default visibility for "balances" is internal. Other possible visibility settings are public and private.

## Source File

- ELTCoin.sol

```
55
56 mapping(address => uint256) balances;
57
58 /**
59 * @dev transfer token for a specified address
60
```

## SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 97

## **low SEVERITY**

It is best practice to set the visibility of state variables explicitly. The default visibility for "allowed" is internal. Other possible visibility settings are public and private.

## Source File

- ELTCoin.sol

```
96
97 mapping (address => mapping (address => uint256)) allowed;
98 bool public isPreSaleReady = false;
99
100 /**
101
```

## SWC-110 | AN ASSERTION VIOLATION WAS TRIGGERED.

LINE 32

## **low SEVERITY**

It is possible to cause an assertion violation. Note that Solidity assert() statements should only be used to check invariants. Review the transaction trace generated for this issue and either make sure your program logic is correct, or use require() instead of assert() if your goal is to constrain user inputs or enforce preconditions. Remember to validate inputs from both callers (for instance, via passed arguments) and callees (for instance, via return values).

#### Source File

- ELTCoin.sol

```
31   uint256 c = a + b;
32   assert(c >= a);
33   return c;
34  }
35  }
36
```

## SWC-110 | AN ASSERTION VIOLATION WAS TRIGGERED.

LINE 26

## **low SEVERITY**

It is possible to cause an assertion violation. Note that Solidity assert() statements should only be used to check invariants. Review the transaction trace generated for this issue and either make sure your program logic is correct, or use require() instead of assert() if your goal is to constrain user inputs or enforce preconditions. Remember to validate inputs from both callers (for instance, via passed arguments) and callees (for instance, via return values).

#### Source File

- ELTCoin.sol

```
function sub(uint256 a, uint256 b) internal constant returns (uint256) {
  assert(b <= a);
  return a - b;
}
</pre>
```

LINE 12

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "mul" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
11  library SafeMath {
12  function mul(uint256 a, uint256 b) internal constant returns (uint256) {
13  uint256 c = a * b;
14  assert(a == 0 || c / a == b);
15  return c;
16
```

LINE 18

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "div" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
17
18 function div(uint256 a, uint256 b) internal constant returns (uint256) {
19 // assert(b > 0); // Solidity automatically throws when dividing by 0
20 uint256 c = a / b;
21 // assert(a == b * c + a % b); // There is no case in which this doesn't hold
22
```

LINE 25

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "sub" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
24
25  function sub(uint256 a, uint256 b) internal constant returns (uint256) {
26  assert(b <= a);
27  return a - b;
28  }
29</pre>
```

LINE 30

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "add" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
29
30  function add(uint256 a, uint256 b) internal constant returns (uint256) {
31   uint256 c = a + b;
32   assert(c >= a);
33   return c;
34
```

LINE 44

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "balanceOf" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
uint256 public totalSupply;

function balanceOf(address who) public constant returns (uint256);

function transfer(address to, uint256 value) public returns (bool);

event Transfer(address indexed from, address indexed to, uint256 value);

}

48
```

LINE 78

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "balanceOf" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
77 */
78 function balanceOf(address _owner) public constant returns (uint256 balance) {
79  return balances[_owner];
80 }
81
82
```

LINE 89

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "allowance" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
88 contract ERC20 is ERC20Basic {
89 function allowance(address owner, address spender) public constant returns
(uint256);
90 function transferFrom(address from, address to, uint256 value) public returns
(bool);
91 function approve(address spender, uint256 value) public returns (bool);
92 event Approval(address indexed owner, address indexed spender, uint256 value);
93
```

**LINE 144** 

## **low SEVERITY**

Using "constant" as a state mutability modifier in function "allowance" is disallowed as of Solidity version 0.5.0. Use "view" instead.

## Source File

- ELTCoin.sol

```
143 */
144 function allowance(address _owner, address _spender) public constant returns
(uint256 remaining) {
145 return allowed[_owner][_spender];
146 }
147
148
```

## **DISCLAIMER**

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to you ("Customer" or the "Company") in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to, or relied upon by any person for any purposes, nor may copies be delivered to any other person other than the Company, without Sysfixed's prior written consent in each instance.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Sysfixed to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model, or legal compliance.

This is a limited report on our findings based on our analysis, in accordance with good industry practice as of the date of this report, in relation to cybersecurity vulnerabilities and issues in the framework and algorithms based on smart contracts, the details of which are set out in this report. In order to get a full view of our analysis, it is crucial for you to read the full report. While we have done our best in conducting our analysis and producing this report, it is important to note that you should not rely on this report and cannot claim against us on the basis of what it says or doesn't say, or how we produced it, and it is important for you to conduct your own independent investigations before making any decisions. We go into more detail on this in the below disclaimer below – please make sure to read it in full.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

This report is provided for information purposes only and on a non-reliance basis and does not constitute investment advice. No one shall have any right to rely on the report or its contents, and Sysfixed and its affiliates (including holding companies, shareholders, subsidiaries, employees, directors, officers, and other representatives) (Sysfixed) owe no duty of care.

## **ABOUT US**

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
