About Us

AUDITED DETAILS

| Audited Project

Project name	Token ticker	Blockchain	
APEBORG	APEBORG	Ethereum	

Addresses

Contract address	0xf168d4f47a973a65f61bfb46f924fe7489c74576	
Contract deployer address	0xdF22e8B5dF7d6472f875DC3752215089cd8ebC5a	

Project Website

https://apeborg.com/

Codebase

https://etherscan.io/address/0xf168d4f47a973a65f61bfb46f924fe7489c74576#code

SUMMARY

APEBORG is a decentralized Meme Token with a NFT Platform, own NFT Collections and a P2E Game to earn and collect tokens. In addition, the APEBORG holders benefit from the reflections on every transaction. This is an auto staking feature. Furthermore, charity activities for people and animals are carried out

Contract Summary

Documentation Quality

APEBORG provides a very good documentation with standard of solidity base code.

• The technical description is provided clearly and structured and also dont have any high risk issue.

Code Quality

The Overall quality of the basecode is standard.

 Standard solidity basecode and rules are already followed by APEBORG with the discovery of several low issues.

Test Coverage

Test coverage of the project is 100% (Through Codebase)

Audit Findings Summary

- SWC-100 SWC-108 | Explicitly define visibility for all state variables on lines 974.
- SWC-103 | Pragma statements can be allowed to float when a contract is intended on lines 15.
- SWC-110 SWC-123 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 1216, 1217, 1217, 1240, 1241, 1241, 1372, 1373, 1375, 1376, 1531 and 1532.
- SWC-115 | tx.origin should not be used for authorization, use msg.sender instead on lines 1450.

CONCLUSION

We have audited the NamaFile project released on January 2023 to discover issues and identify potential security vulnerabilities in NamaFile Project. This process is used to find technical issues and security loopholes which might be found in the smart contract.

The security audit report provides a satisfactory result with some low-risk issues.

The issues found in the NamaFile smart contract code do not pose a considerable risk. The writing of the contract is close to the standard of writing contracts in general. The low-risk issues found are some arithmetic operation issues, a floating pragma is set, a state variable visibility is not set, and out-of-bounds array access which the index access expression can cause an exception in case of the use of an invalid array index value. We recommend to It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code also avoiding using "tx.origin" as a security control can lead to authorization bypass vulnerabilities. Consider using "msg.sender" unless you really know what you are doing.

AUDIT RESULT

Article	Category	Description	Result	
Default Visibility	SWC-100 SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	ISSUE FOUND	
Integer Overflow and Underflow	SWC-101	If unchecked math is used, all math operations should be safe from overflows and underflows.	ISSUE FOUND	
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.	PASS	
Floating Pragma	SWC-103	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	ISSUE FOUND	
Unchecked Call Return Value	SWC-104	The return value of a message call should be checked.	d be PASS	
Unprotected Ether Withdrawal	SWC-105	Due to missing or insufficient access controls, malicious parties can withdraw from the contract.	PASS	
SELFDESTRUCT Instruction	SWC-106	The contract should not be self-destructible while it has funds belonging to users.	PASS	
Reentrancy	SWC-107	7 Check effect interaction pattern should be followed if the code performs recursive call.		
Uninitialized Storage Pointer	SWC-109	Uninitialized local storage variables can point to unexpected storage locations in the contract.		
Assert Violation	SWC-110 SWC-123	. ,		
Deprecated Solidity Functions	SWC-111	Deprecated built-in functions should never be used.	PASS	
Delegate call to Untrusted Callee	SWC-112	Delegatecalls should only be allowed to trusted addresses.	PASS	

DoS (Denial of Service)	SWC-113 SWC-128	Execution of the code should never be blocked by a specific contract state unless required.	PASS
Race Conditions	SWC-114	Race Conditions and Transactions Order Dependency should not be possible.	PASS
Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	ISSUE FOUND
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	PASS
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Incorrect Constructor Name	SWC-118	Constructors are special functions that are called only once during the contract creation.	PASS
Shadowing State Variable	SWC-119	State variables should not be shadowed.	PASS
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	
Write to Arbitrary Storage Location	SWC-124	The contract is responsible for ensuring that only authorized user or contract accounts may write to sensitive storage locations.	PASS
Incorrect Inheritance Order	SWC-125	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order. The rule of thumb is to inherit contracts from more /general/ to more /specific/.	
Insufficient Gas Griefing	SWC-126	Insufficient gas griefing attacks can be performed on contracts which accept data and use it in a sub-call on another contract.	
Arbitrary Jump Function	SWC-127	As Solidity doesnt support pointer arithmetics, it is impossible to change such variable to an arbitrary value.	PASS

Typographical Error	SWC-129	A typographical error can occur for example when the intent of a defined operation is to sum a number to a variable.	
Override control character	SWC-130	Malicious actors can use the Right-To-Left-Override unicode character to force RTL text rendering and confuse users as to the real intent of a contract.	
Unused variables	SWC-131 SWC-135	Unused variables are allowed in Solidity and they do not pose a direct security issue.	PASS
Unexpected Ether balance	SWC-132	Contracts can behave erroneously when they strictly assume a specific Ether balance.	
Hash Collisions Variable	SWC-133	Using abi.encodePacked() with multiple variable length arguments can, in certain situations, lead to a hash collision.	
Hardcoded gas amount	SWC-134	The transfer() and send() functions forward a fixed amount of 2300 gas.	PASS
Unencrypted Private Data	SWC-136	It is a common misconception that private type variables cannot be read.	PASS

1398 {
1399  return _amount.mul(_liquidityFee).div(10**2);
1400 }
1401
1402  function removeAllFee() private {
1403
```

SWC-101 | ARITHMETIC OPERATION "+" DISCOVERED

LINE 1456

low SEVERITY

This plugin produces issues to support false positive discovery within mythril.

Source File

- APEBORG.sol

```
1455 if(to != uniswapV2Pair) {
1456  require(balanceOf(to) + amount < _maxWalletSize, "TOKEN: Balance exceeds wallet
size!");
1457  }
1458  }
1459
1460</pre>
```

SWC-101 | COMPILER-REWRITABLE "<UINT> - 1" DISCOVERED

LINE 1218

low SEVERITY

This plugin produces issues to support false positive discovery within mythril.

Source File

- APEBORG.sol

```
1217   _blackListedBots[i] = _blackListedBots[
1218   _blackListedBots.length - 1
1219  ];
1220   _isBlackListedBot[account] = false;
1221   _blackListedBots.pop();
1222
```

SWC-101 | COMPILER-REWRITABLE "<UINT> - 1" DISCOVERED

LINE 1241

low SEVERITY

This plugin produces issues to support false positive discovery within mythril.

Source File

- APEBORG.sol

```
if (_excluded[i] == account) {
  l241    _excluded[i] = _excluded[_excluded.length - 1];
  l242    _tOwned[account] = 0;
  l243    _isExcluded[account] = false;
  l244    _excluded.pop();
  l245
```

SWC-103 | A FLOATING PRAGMA IS SET.

LINE 15

low SEVERITY

The current pragma Solidity directive is ""^0.8.10"". It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code.

Source File

- APEBORG.sol

```
/// @custom:security-contact contact@apeborg.com
pragma solidity ^0.8.10;

// SPDX-License-Identifier: Unlicensed
interface IERC20 {
```

SWC-108 | STATE VARIABLE VISIBILITY IS NOT SET.

LINE 974

low SEVERITY

It is best practice to set the visibility of state variables explicitly. The default visibility for "inSwapAndLiquify" is internal. Other possible visibility settings are public and private.

Source File

- APEBORG.sol

```
973
974 bool inSwapAndLiquify;
975 bool public swapAndLiquifyEnabled = true;
976
977 uint256 public _maxTxAmount = 10000000000 * 10**6 * 10**9;
978
```

SWC-115 | USE OF "TX.ORIGIN" AS A PART OF AUTHORIZATION CONTROL.

LINE 1450

low SEVERITY

Using "tx.origin" as a security control can lead to authorization bypass vulnerabilities. Consider using "msg.sender" unless you really know what you are doing.

Source File

- APEBORG.sol

```
require(!_isBlackListedBot[msg.sender], "you are blacklisted");
require(!_isBlackListedBot[tx.origin], "blacklisted");

1451
1452 if (!_isExcludedFromLimit[from] && !_isExcludedFromLimit[to]) {
    require(amount <= _maxTxAmount, "Transfer amount exceeds the maxTxAmount.");

1454
```

LINE 1216

low SEVERITY

The index access expression can cause an exception in case of use of invalid array index value.

Source File

- APEBORG.sol

```
1215 for (uint256 i = 0; i < _blackListedBots.length; i++) {
1216   if (_blackListedBots[i] == account) {
1217    _blackListedBots[i] = _blackListedBots[
1218    _blackListedBots.length - 1
1219   ];
1220</pre>
```

LINE 1217

low SEVERITY

The index access expression can cause an exception in case of use of invalid array index value.

Source File

- APEBORG.sol

```
1216  if (_blackListedBots[i] == account) {
1217    _blackListedBots[i] = _blackListedBots[

ABOUT US

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
