SUMMARY

The idea of building a perfect island, a utopia, would be difficult to imagine if it was not for MetaFI. MetaFI is short for Metaverse-Finance, which describes finance integration in the Metaverse. When blockchain gave birth to cryptocurrency, it was a sign that it was possible to fractionalize and financialize in the Metaverse. To realize the idea of Meta-Utopia, we must understand how MetaFI can connect the island, the cities, and its citizens. A free economy must drive a free society, a creator and contributor system that rewards pretty. The topics in this Gitbook are keys to building this system. EVERYONE wants to be part of the Metaverse in the future. Blockchain provides the trust and transparency that is needed. With the introduction of Web 3.0, the Semantic Web, and natural life infrastructures, technology now exists to make connectivity possible. The potential of the Power of the Community will be applied in a decentralized manner. Governance will be conducted through a DAO or Distributed Autonomous Organization, and its economy will run on DeFI Protocols. With these rules in place, we can now discuss creating a system and building a Utopia in the Metaverse.

Contract Summary

Documentation Quality

META-UTOPIA LAND provides a very good documentation with standard of solidity base code.

• The technical description is provided clearly and structured and also dont have any high risk issue.

Code Quality

The Overall quality of the basecode is standard.

 Standard solidity basecode and rules are already followed by META-UTOPIA LAND with the discovery of several low issues.

Test Coverage

Test coverage of the project is 100% (Through Codebase)

Audit Findings Summary

- SWC-100 SWC-108 | Explicitly define visibility for all state variables on lines 1039, 1044, 1058 and 1059.
- SWC-101 | It is recommended to use vetted safe math libraries for arithmetic operations consistently on lines 356, 386, 422, 424, 445, 446, 471, 473, 525, 1052, 1053, 1054, 1055, 1056, 1063, 1075, 1075, 1197, 1203, 1205, 1206, 1208, 1208, 1208, 1231, 1231, 1232, 1232, 1238, 1238, 1241, 1241, 1251, 1251 and 1253.

- SWC-103 | Pragma statements can be allowed to float when a contract is intended on lines 10, 101, 129, 155, 575, 655, 689, 852, 903, 1016 and 1035.
- SYMP(XEI) 0 SWC-123 | It is recommended to use of revert(), assert(), and require() in Solidity, and the new REVERT opcode in the EVM on lines 1050 and 1206.
 - SWC-115 | tx.origin should not be used for authorization, use msg.sender instead on lines 1130.

CONCLUSION

We have audited the META-UTOPIA LAND project released on March 2022 to discover issues and identify potential security vulnerabilities in META-UTOPIA LAND Project. This process is used to find technical issues and security loopholes which might be found in the smart contract.

The security audit report provides satisfactory results with low-risk issues.

The META-UTOPIA LAND smart contract code issues do not pose a considerable risk. The writing of the contract is close to the standard of writing contracts in general. The low-risk issues found are some arithmetic operation issues, a floating pragma is set, a state variable visibility is not set, a public state variable with array type causing reachable exception by default, and out-of-bounds array access which the index access expression can cause an exception in case of the use of an invalid array index value. The current pragma Solidity directive is ""^0.8.0"". It is recommended to specify a fixed compiler version to ensure that the bytecode produced does not vary between builds. This is especially important if you rely on bytecode-level verification of the code. State variable visibility is not set, It is best practice to set the visibility of state variables explicitly. The default visibility for "_stakeAddress" is internal. Other possible visibility settings are public and private. Use of "tx.origin" as a part of authorization control, The tx.origin environment variable has been found to influence a control flow decision. Note that using "tx.origin" as a security control might cause a situation where a user inadvertently authorizes a smart contract to perform an action on their behalf. It is recommended to use "msg.sender" instead.

AUDIT RESULT

Article	Category	Description	Result
Default Visibility	SWC-100 SWC-108	Functions and state variables visibility should be set explicitly. Visibility levels should be specified consciously.	ISSUE FOUND
Integer Overflow and Underflow	SWC-101	If unchecked math is used, all math operations should be safe from overflows and underflows.	ISSUE FOUND
Outdated Compiler Version	SWC-102	It is recommended to use a recent version of the Solidity compiler.	PASS
Floating Pragma	SWC-103	Contracts should be deployed with the same compiler version and flags that they have been tested thoroughly.	ISSUE FOUND
Unchecked Call Return Value	Return Value SWC-104 Checked. Due to missing or insufficient access controls, malicious parties can withdraw from the contract. SELFDESTRUCT Instruction Reentrancy SWC-106 SWC-107 Check effect interaction pattern should be followed if the code performs recursive call. Uninitialized Storage Pointer SWC-109 SWC-109 Uninitialized local storage variables can point to unexpected storage locations in the contract. SWC-110 SWC-123 Properly functioning code should never reach a failing assert statement.		PASS
Unprotected Ether Withdrawal			PASS
SELFDESTRUCT Instruction			PASS
Reentrancy			PASS
Uninitialized Storage Pointer			PASS
Assert Violation			ISSUE FOUND
Deprecated Solidity Functions			PASS
Delegate call to Untrusted Callee Delegate calls should only be allowed to trusted addresses.		PASS	

DoS (Denial of SWC-113 Execution of the code should never be block specific contract state unless required.		Execution of the code should never be blocked by a specific contract state unless required.	PASS
Race Conditions	SWC-114	Race Conditions and Transactions Order Dependency should not be possible.	PASS
Authorization through tx.origin	SWC-115	tx.origin should not be used for authorization.	ISSUE FOUND
Block values as a proxy for time	SWC-116	Block numbers should not be used for time calculations.	PASS
Signature Unique ID	SWC-117 SWC-121 SWC-122	Signed messages should always have a unique id. A transaction hash should not be used as a unique id.	PASS
Incorrect Constructor Name	SWC-118	Constructors are special functions that are called only once during the contract creation.	PASS
Shadowing State Variable	SWC-119	State variables should not be shadowed.	PASS
Weak Sources of Randomness	SWC-120	Random values should never be generated from Chain Attributes or be predictable.	PASS
Write to Arbitrary Storage Location	SWC-124	The contract is responsible for ensuring that only authorized user or contract accounts may write to sensitive storage locations.	PASS
Incorrect Inheritance Order	SWC-125	When inheriting multiple contracts, especially if they have identical functions, a developer should carefully specify inheritance in the correct order. The rule of thumb is to inherit contracts from more /general/ to more /specific/.	PASS
Insufficient Gas Griefing	SWC-126	Insufficient gas griefing attacks can be performed on contracts which accept data and use it in a sub-call on another contract.	PASS
Arbitrary Jump Function	SWC-127	As Solidity doesnt support pointer arithmetics, it is impossible to change such variable to an arbitrary value.	PASS

Typographical Error	SWC-129		PASS
Override control character	SWC-130	Malicious actors can use the Right-To-Left-Override unicode character to force RTL text rendering and confuse users as to the real intent of a contract.	
Unused variables	SWC-131 SWC-135	Unused variables are allowed in Solidity and they do not pose a direct security issue.	PASS
Unexpected Ether balance Hash Collisions Variable Hardcoded gas amount SWC-133 SWC-134 Unencrypted Private Data		Contracts can behave erroneously when they strictly assume a specific Ether balance.	
		Using abi.encodePacked() with multiple variable length arguments can, in certain situations, lead to a hash collision.	PASS
		The transfer() and send() functions forward a fixed amount of 2300 gas.	
		It is a common misconception that private type variables cannot be read.	PASS

DISCLAIMER

This report is subject to the terms and conditions (including without limitation, description of services, confidentiality, disclaimer and limitation of liability) set forth in the Services Agreement, or the scope of services, and terms and conditions provided to you ("Customer" or the "Company") in connection with the Agreement. This report provided in connection with the Services set forth in the Agreement shall be used by the Company only to the extent permitted under the terms and conditions set forth in the Agreement. This report may not be transmitted, disclosed, referred to, or relied upon by any person for any purposes, nor may copies be delivered to any other person other than the Company, without Sysfixed's prior written consent in each instance.

This report is not, nor should be considered, an "endorsement" or "disapproval" of any particular project or team. This report is not, nor should be considered, an indication of the economics or value of any "product" or "asset" created by any team or project that contracts Sysfixed to perform a security assessment. This report does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed, nor do they provide any indication of the technologies proprietors, business, business model, or legal compliance.

This is a limited report on our findings based on our analysis, in accordance with good industry practice as of the date of this report, in relation to cybersecurity vulnerabilities and issues in the framework and algorithms based on smart contracts, the details of which are set out in this report. In order to get a full view of our analysis, it is crucial for you to read the full report. While we have done our best in conducting our analysis and producing this report, it is important to note that you should not rely on this report and cannot claim against us on the basis of what it says or doesn't say, or how we produced it, and it is important for you to conduct your own independent investigations before making any decisions. We go into more detail on this in the below disclaimer below – please make sure to read it in full.

This report should not be used in any way to make decisions around investment or involvement with any particular project. This report in no way provides investment advice, nor should be leveraged as investment advice of any sort. This report represents an extensive assessing process intending to help our customers increase the quality of their code while reducing the high level of risk presented by cryptographic tokens and blockchain technology.

This report is provided for information purposes only and on a non-reliance basis and does not constitute investment advice. No one shall have any right to rely on the report or its contents, and Sysfixed and its affiliates (including holding companies, shareholders, subsidiaries, employees, directors, officers, and other representatives) (Sysfixed) owe no duty of care.

ABOUT US

Sysfixed is a blockchain security certification organization established in 2021 with the objective to provide smart contract security services and verify their correctness in blockchain-based protocols. Sysfixed automatically scans for security vulnerabilities in Ethereum and other EVM-based blockchain smart contracts. Sysfixed a comprehensive range of analysis techniques—including static analysis, dynamic analysis, and symbolic execution—can accurately detect security vulnerabilities to provide an in-depth analysis report. With a vibrant ecosystem of world-class integration partners that amplify developer productivity, Sysfixed can be utilized in all phases of your project's lifecycle. Our team of security experts is dedicated to the research and improvement of our tools and techniques used to fortify your code.
